

Food App India Account Migration Runbook

Generated: 2026-05-28

Project folder: /Users/shantanuodak/Desktop/Codex Folders/Food App/Food App

This is the end-to-end operator runbook for moving Food App from the current US Apple/TestFlight path to a fresh Indian individual Apple Developer account, while also planning ownership/billing migration for Supabase, Render, Google Cloud / Google AI Studio, Replit, and later RevenueCat.

This is not an App Store Connect app transfer. The current app has not been publicly released, so the correct path is to create a fresh app record under the Indian individual Apple Developer account and upload a fresh build there.

Golden Rules

- Do not delete the current US App Store Connect app record yet.
- Do not submit or publicly release from the US account if the desired first public listing should show the Indian account name.
- Do not share Apple ID passwords or 2FA codes. If the Indian Apple ID is yours, sign in normally. If it belongs to someone else, use App Store Connect roles and manual signing.
- Move one production dependency at a time. Do not migrate Apple, database, backend, AI keys, APNs, OAuth, and payments in one big bang.
- Use a stable API custom domain before public release, for example `https://api.<your-domain>.com`, so future Render moves do not require an App Store update.
- Keep the app free until the India Apple/TestFlight path is proven. Add RevenueCat and subscriptions after the Indian app record and first upload work.
- Keep all migration secrets out of Git: API keys, .p8 APNs private keys, service role keys, App Store Connect API keys, and private certificates.

Current Repository Audit

Project type: native Swift iOS app in Xcode.
